The Trend of computing

September 25th, 2020

Since computing and coding started to become more and more important in our age, I've tried to catch up this trend by learning Swift which was developed by Apple. Through out Swift and their introduction videos or websites, I've learned that Apple try to make more people learn how to code by cooperating with colleges in the State like Stanford university, or other colleges in Europe. Their plan is called "everyone can code scheme" you don't need a computer to code, instead, you just need an iPad and install Swift, and that's it! If you're a beginner, there are three different courses: learn to code 1-3. 1 is the easiest but which you learn the most basic things in. I'm now learning Swift in my own because it is really fun to learn and easy to write (we'll probably it's because I'm just a beginner), but i do have ideas in my head of trying to develop something that could make our world better or make our life more convenient.

Schools like Stanford even work with apple trying to make their students to have the ability to code, it really is a must for us to learning any of the language to communicate with computer. I definitely agree every school of taking learning computing skills as a must learn class, plus in the world we have to analyze so many data from everywhere, if we don't have the skills to set up a function and ask the computer to analyze everything for us, it would take us years and years to finish those tasks that could be done in like few minutes for computer.
